# Chapter I

## Instructions

- Only this page will serve as reference: do not trust rumors.
- Watch out! This document could potentially change before submission.
- Make sure you have the appropriate permissions on your files and directories.
- You have to follow the submission procedures for all your exercises.
- Your exercises will be checked and graded by your fellow classmates.
- On top of that, your exercises will be checked and graded by a program called Moulinette.
- Moulinette is very meticulous and strict in its evaluation of your work. It is entirely automated and there is no way to negotiate with it. So if you want to avoid bad surprises, be as thorough as possible.
- Moulinette is not very open-minded. It won't try and understand your code if it doesn't respect the Norm. Moulinette relies on a program called `norminette` to check if your files respect the norm. TL;DR: it would be idiotic to submit a piece of work that doesn't pass `norminette`'s check.
- These exercises are carefully laid out by order of difficulty - from easiest to hardest. We **will not** take into account a successfully completed harder exercise if an easier one is not perfectly functional.
- Using a forbidden function is considered cheating. Cheaters get **-42**, and this grade is non-negotiable.
- You'll only have to submit a `main()` function if we ask for a program.
- Moulinette compiles with these flags: `-Wall -Wextra -Werror`, and uses `gcc`.
- If your program doesn't compile, you'll get 0.
- You cannot leave any additional file in your directory than those specified in the subject.
- Got a question? Ask your peer on the right. Otherwise, try your peer on the left.

- Your reference guide is called `Google / man / the Internet / ....`
- Check out the "C Piscine" part of the forum on the intranet, or the slack Piscine.
- Examine the examples thoroughly. They could very well call for details that are not explicitly mentioned in the subject...
- By Odin, by Thor ! Use your brain !!!

# Chapter II

## Foreword

Here's what Wikipedia have to say about Platypus :

The platypus (*Ornithorhynchus anatinus*), also known as the duck-billed platypus, is a semiaquatic egg-laying mammal endemic to eastern Australia, including Tasmania. Together with the four species of echidna, it is one of the five extant species of monotremes, the only mammals that lay eggs instead of giving birth. The animal is the sole living representative of its family (*Ornithorhynchidae*) and genus (*Ornithorhynchus*), though a number of related species have been found in the fossil record.

The unusual appearance of this egg-laying, duck-billed, beaver-tailed, otter-footed mammal baffled European naturalists when they first encountered it, with some considering it an elaborate hoax. It is one of the few venomous mammals, the male platypus having a spur on the hind foot that delivers a venom capable of causing severe pain to humans. The unique features of the platypus make it an important subject in the study of evolutionary biology and a recognisable and iconic symbol of Australia; it has appeared as a mascot at national events and is featured on the reverse of its 20-cent coin. The platypus is the animal emblem of the state of New South Wales.

Until the early 20th century, it was hunted for its fur, but it is now protected throughout its range. Although captive breeding programs have had only limited success and the platypus is vulnerable to the effects of pollution, it is not under any immediate threat.

This subject is absolutly not talking about platypus.

# Chapter III

## Exercise 00 : ft.h

	Exercise 00
	ft.h
Turn-in directory : <i>ex00/</i>	
Files to turn in : <b>ft.h</b>	
Allowed functions : <b>None</b>	

- Create your **ft.h** file.
- It contains all prototypes of functions :

```
void    ft_putchar(char c);
void    ft_swap(int *a, int *b);
void    ft_putstr(char *str);
int     ft_strlen(char *str);
int     ft_strcmp(char *s1, char *s2);
```

# Chapter IV

## Exercise 01 : ft\_boolean.h

	Exercise 01
	ft_boolean.h
	Turn-in directory : <i>ex01/</i>
	Files to turn in : <b>ft_boolean.h</b>
	Allowed functions : None

- Create a `ft_boolean.h` file. It'll compile and run the following main appropriately :

```
#include "ft_boolean.h"

void      ft_putstr(char *str)
{
    while (*str)
        write(1, str++, 1);
}

t_bool    ft_is_even(int nbr)
{
    return ((EVEN(nbr)) ? TRUE : FALSE);
}

int       main(int argc, char **argv)
{
    (void)argv;
    if (ft_is_even(argc - 1) == TRUE)
        ft_putstr(EVEN_MSG);
    else
        ft_putstr(ODD_MSG);
    return (SUCCESS);
}
```

- This program should display

```
I have an even number of arguments.
```

- ou

```
I have an odd number of arguments.
```

- followed by a line break when adequate.

Norminette must be launched with the `-R CheckForbiddenSourceHeader` flag. Moulinette will use it too.

# Chapter V

## Exercise 02 : ft\_abs.h

	Exercise 02
	ft_abs.h
	Turn-in directory : <i>ex02/</i>
	Files to turn in : <b>ft_abs.h</b>
	Allowed functions : None

- Create a macro ABS which replaces its argument by its absolute value :

```
#define ABS(Value)
```

Norminette must be launched with the `-R CheckForbiddenSourceHeader` flag. Moulinette will use it too.

# Chapter VI

## Exercise 03 : ft\_point.h

	Exercise 03
	ft_point.h
	Turn-in directory : <i>ex03/</i>
	Files to turn in : <b>ft_point.h</b>
	Allowed functions : None

- Create a file **ft\_point.h** that'll compile the following main :

```
#include "ft_point.h"

void      set_point(t_point *point)
{
    point->x = 42;
    point->y = 21;
}

int      main(void)
{
    t_point      point;

    set_point(&point);
    return (0);
}
```

# Chapter VII

## Exercise 04 : ft\_strs\_to\_tab

	Exercise 04
	ft_strs_to_tab
	Turn-in directory : <i>ex04/</i>
	Files to turn in : <b>ft_strs_to_tab.c</b>
	Allowed functions : <b>malloc, free</b>

- Create a function that takes an array of string as argument and the size of this array.
- Here's how it should be prototyped :

```
struct s_stock_str *ft_strs_to_tab(int ac, char **av);
```

- It will transform each element of av into a structure.
- The structure will be defined in the **ft\_stock\_str.h** file that we will provided, like this :

```
typedef struct s_stock_str
{
    int size;
    char *str;
    char *copy;
} t_stock_str;
```

- size being the length of the string;
  - str being string;
  - copy being a copy of the string ;
- It should keep the order of av.

- The returned array should be allocated in memory and its last element's `str` set to 0, this will mark the end of the array.
- It should return a NULL pointer if an error occurs.
- We'll test your function with our `ft_show_tab` (next exercise). Make it work according to this !

# Chapter VIII

## Exercise 05 : ft\_show\_tab

	Exercise 05
	ft_show_tab
	Turn-in directory : <i>ex05/</i>
	Files to turn in : <b>ft_show_tab.c</b>
	Allowed functions : <b>write</b>

- Create a function that displays the content of the array created by the previous function.
- Here's how it should be prototyped :

```
void ft_show_tab(struct s_stock_str *par);
```

- The structure will be the same as the previous exercise and will be defined in the **ft\_stock\_str.h** file
- For each element, we'll display:
  - the string followed by a '\n'
  - the size followed by a '\n'
  - the copy of the string (that could have been modified) followed by a '\n'
- We'll test your function with our **ft\_strs\_to\_tab** (previous exercise). Make it work according to this !
